

Derivation of Hardy-Weinberg Equilibrium

Generation 1:

Genotype frequencies

Frequency MM = u

Frequency MN = v

Frequency NN = w

Remember, frequencies sum to 1, so $u + v + w = 1$

Allele frequencies

Frequency M = $u + v/2 = p$

Frequency N = $w + v/2 = q = 1 - p$

Remember, frequencies sum to 1, so $p + q = 1$ if there are only two alleles.

Mating Type	MM	MN	NN	frequency of mating
MM x MM	1	0	0	$u * u$
MM x MN	0.5	0.5	0	$2uv$
MM x NN	0	1	0	$2uw$
MN x MN	.25	.5	.25	$v * v$
MN x NN	0	.5	.5	$2vw$
NN x NN	0	0	1	$w * w$

Generation 2 (and all subsequent generations, provided assumptions are met)

Genotype frequencies

$$\begin{aligned}
 \text{Frequency MM} &= 1 * u^2 + 0.5 * (2uv) + 0.25 * v^2 \\
 &= u^2 + uv + 0.25v^2 \\
 &= (u + v/2)^2 \\
 &= p^2
 \end{aligned}$$

$$\begin{aligned}
 \text{Frequency MN} &= 0.5 * (2uv) + 1 * (2uw) + 0.5 * v^2 + 0.5 * (2vw) \\
 &= uv + 2uw + 0.5v^2 + vw \\
 &= 2(u + v/2)(w + v/2) \\
 &= 2pq
 \end{aligned}$$

$$\begin{aligned}
 \text{Frequency NN} &= 0.25 * v^2 + 0.5 * (2vw) + 1 * w^2 \\
 &= 0.25v^2 + vw + w^2 \\
 &= (v/2 + w)^2 \\
 &= q^2
 \end{aligned}$$

Allele frequencies

$$\begin{aligned}
 \text{Frequency M} &= p^2 + 0.5 * 2pq \\
 &= p^2 + pq \\
 &= p * (p + q) \\
 &= p
 \end{aligned}$$

$$\begin{aligned}
 \text{Frequency N} &= q^2 + 0.5 * 2pq \\
 &= q^2 + pq \\
 &= q * (q + p) \\
 &= q
 \end{aligned}$$
