## HARDY WEINBERG THEOREM DERIVATION

In a population with two alleles " $A$ " and " $a$ "...

Let proportion of $A A=D$ (dominant genotype);

$$
\begin{aligned}
& \mathbf{A a}=\mathbf{H} \text { (heterozygote genotype) } \\
& \mathbf{a a}=\mathbf{R} \text { (recessive genotype) }
\end{aligned}
$$

Then $\mathbf{D}+\mathbf{H}+\mathbf{R}=\mathbf{1}$
Let $p=$ allele frequency of " $A$ " $\& q=$ allele freq. of " $a$ " $p=D+1 / 2 H ; q=R+1 / 2 H$

| m |  | f | Freq. mating | AA | Progeny Aa | aa |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AA | x | AA | DD | $\mathrm{D}^{2}$ |  |  |
| AA | X | Aa | DH | DH/2 | DH/2 |  |
| Aa | X | AA | HD | DH/2 | DH/2 |  |
| AA | x | aa | DR |  | DR |  |
| aa | X | AA | RD |  | DR |  |
| Aa | X | Aa | HH | $\mathrm{H}^{2} / 4$ | $\mathbf{H}^{2} / 2$ | $\mathbf{H}^{2} / 4$ |
| aa | X | Aa | RH |  | HR/2 | HR/2 |
| Aa | x | aa | HR |  | HR/2 | HR/2 |
| aa | X | aa | RR |  |  | $\mathbf{R}^{2}$ |

Totals: $\quad \mathbf{D}^{\mathbf{2}}+\mathbf{D H}+\mathbf{1 / 4} \mathbf{H}^{\mathbf{2}}$

$$
\begin{aligned}
& =(\mathrm{D}+1 / 2 \mathrm{H})^{2} \\
& =\mathrm{p}^{2} \\
& \begin{aligned}
& \mathrm{DH}+\mathbf{2} \mathrm{DR}+\mathbf{H R}+\mathbf{H}^{2} / \mathbf{2} \\
&=\mathbf{2 ( D}+\mathbf{1} / \mathbf{2} \mathbf{H})(\mathbf{1} / \mathbf{2} \mathbf{H}+\mathbf{R}) \\
&= \mathbf{2 p q}
\end{aligned}
\end{aligned}
$$

$$
\begin{aligned}
& \mathbf{1 / 4} \mathbf{H}^{2}+\mathbf{H R}+\mathbf{R}^{2} \\
& =(\mathbf{1} / 2 \mathbf{H}+\mathbf{R})^{2} \\
& =\mathbf{q}^{2}
\end{aligned}
$$
