

Auchenorrhyncha PEET Workshop

9-11 March 2007

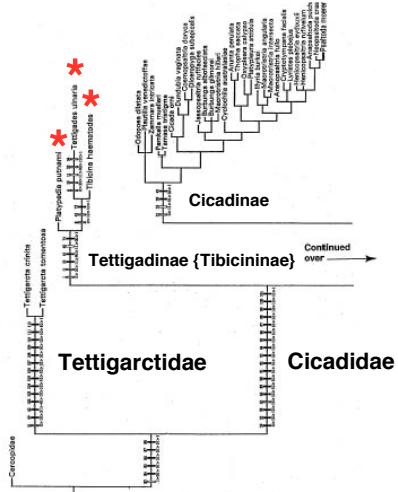

Cicadoidea Part I: Overview of Phylogeny

Acknowledgments

World collectors/collaborators: Yves Basset, Michel Boulard, Thomas Buckley, Jian-Hong Chen, Jason Cryan, Chris Dietrich, John Dugdale, Hans Duffels, David Emery, Matja Gogala, Geert Goemans/Lois O'Brien, Stephane Puissant, Tomi Trilar, Allen Sanborn, Jerome Sueur, Martin Villet, Matt Whiles, Julie Urban

Simon Lab people contributing (not including co-authors): Peter Arensburger, John Cooley, Michael Cordiero

Support: The US National Science Foundation, The NZ Marsden Fund, The National Geographic Society, The Fulbright Foundation, The University of Connecticut, and Victoria University of Wellington.

Moulds 2005

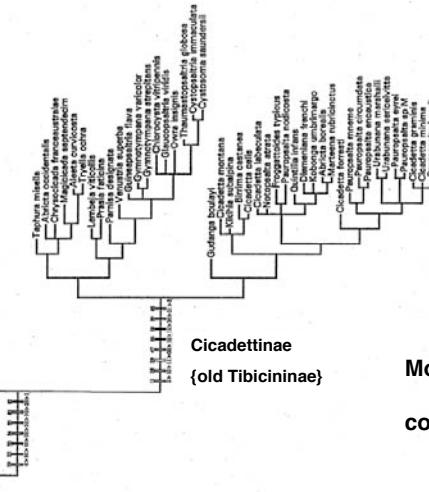

Basal nodes and character transformations shown are the same for all 161 MP trees.

A. Overview of Taxonomy of Cicadoidea (Max Moulds and Kathy Hill)

B. Molecular Phylogeny of Cicadettini (Vanderpool, Marshall, Hill, Moulds, Simon)

Moulds 2005, Fig 1. Historical family (caps) and subfamily concepts Timbal covers vs. none

Moulds 2005

continued

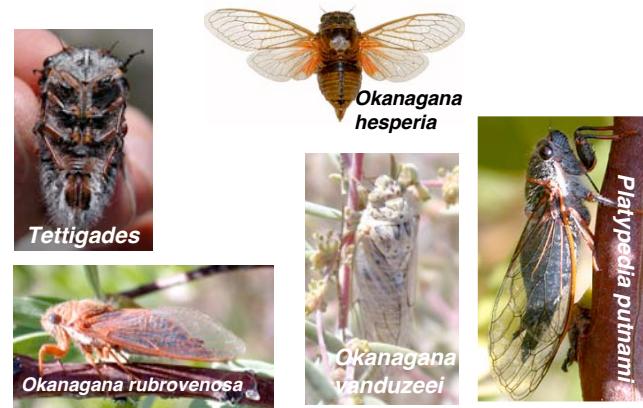

Moulds 2005

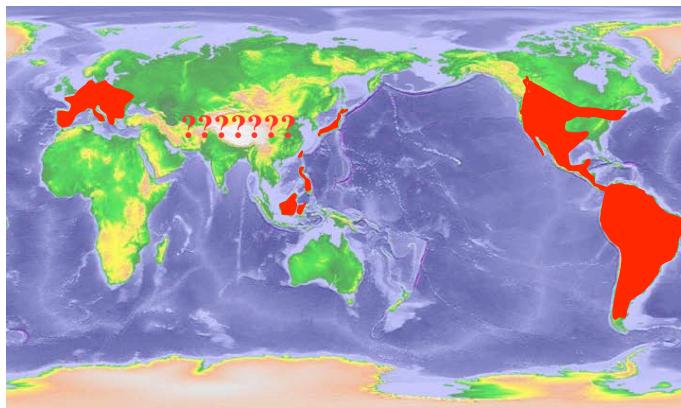

Tettigadinae

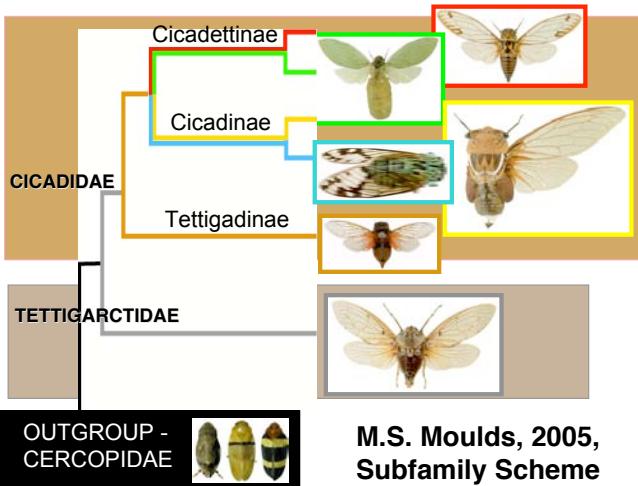

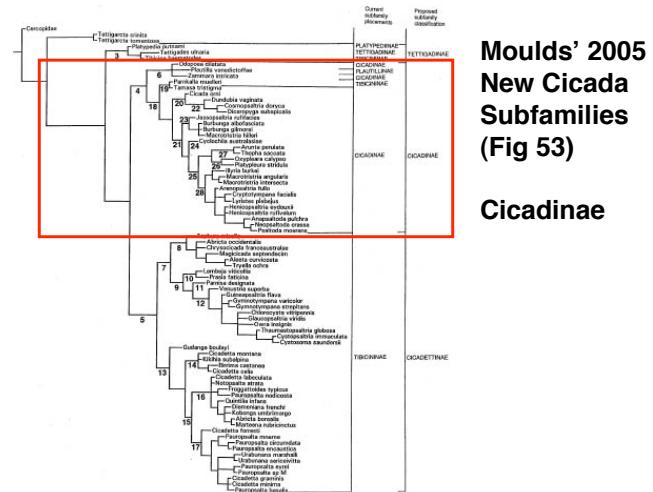

K. Hill & D. Marshall

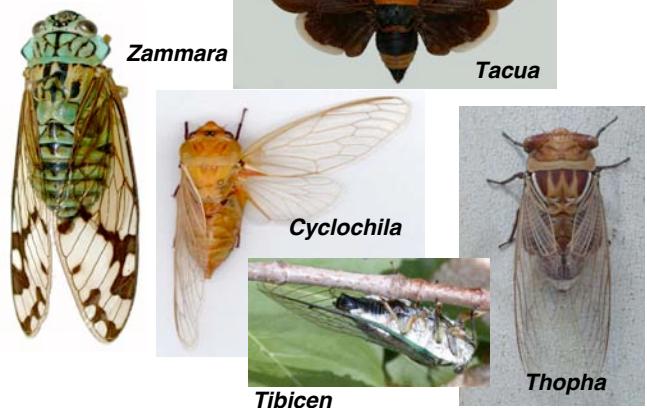

Worldwide Tettigadinae distribution

Approximately 200? extant species

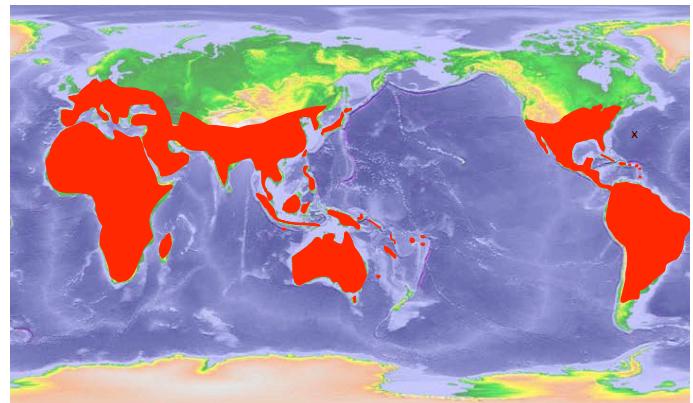

Cicadinae

Platyleurini, Ugada limbata, Ghana
Pinned from alcohol, photo K. Hill

Worldwide Cicadinae distribution

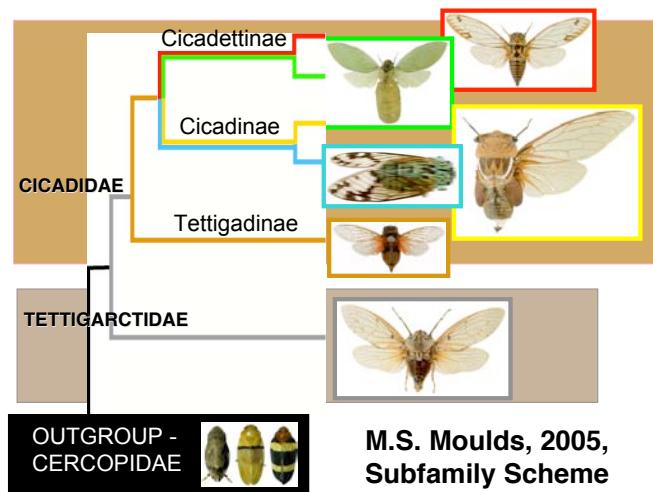

Perhaps 1000 extant species

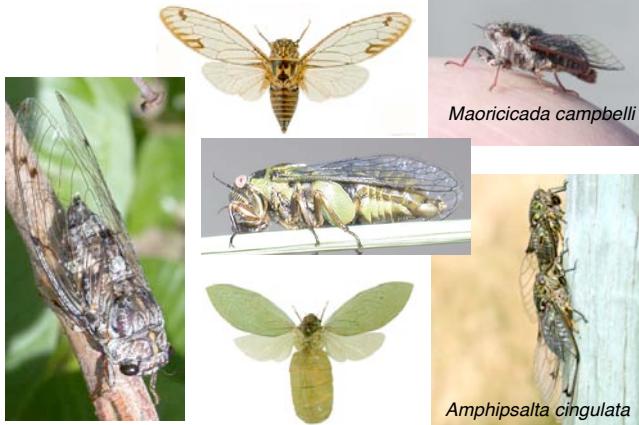

Moulds' 2005 New Cicada Subfamilies (Fig 53)

Cicadettinae
formerly
Tibicininae
(part)

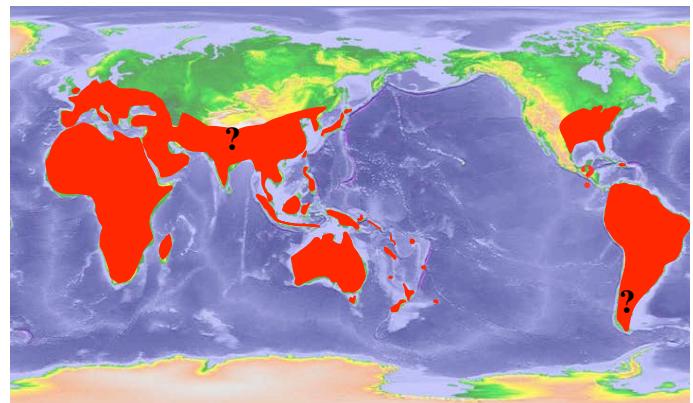

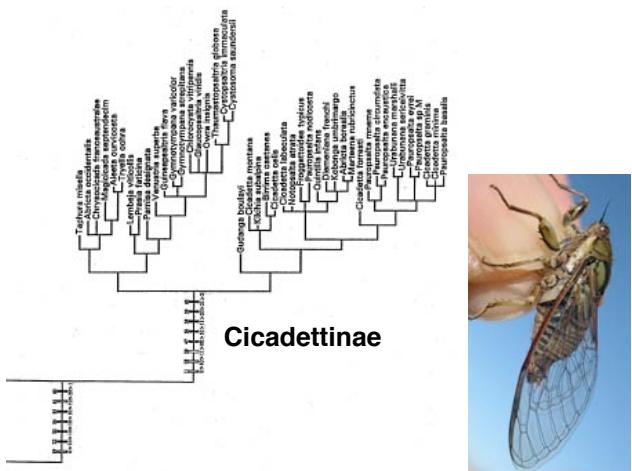

M.S. Moulds, 2005,
Subfamily Scheme

Cicadettinae

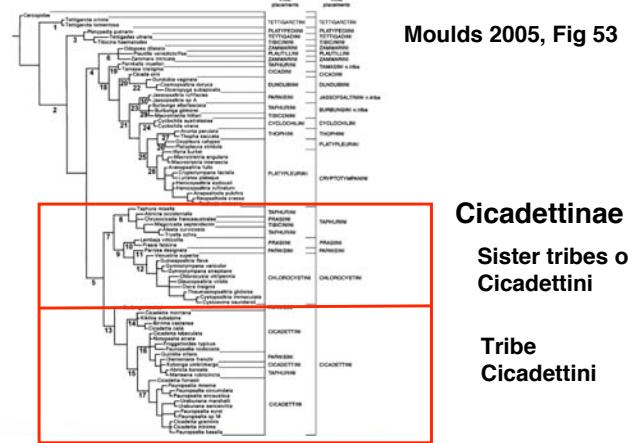

Worldwide Cicadettinae distribution

Cicada Tribes Not Well-Defined

Sister Tribes of Cicadettini

Chlorocystini
Parnisini
Prasiini
Taphurini

Moulds (2005) unnamed monophyletic group (Chlorocystini Parnisini, Prasiini, Taphurini).

Magicicada moved to Taphurini

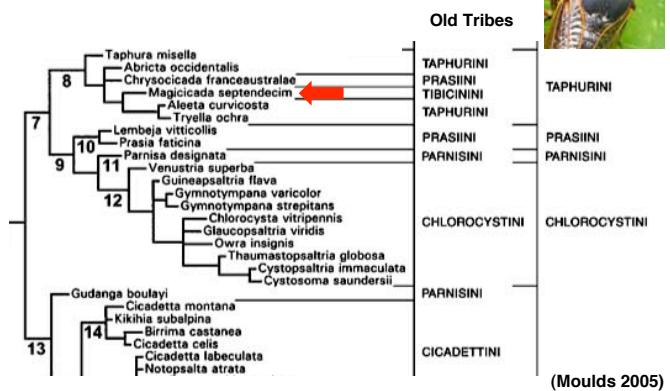

Carinetini*
Dazini
Hemidictyini*
Huechysini
Lamotialnini
Tettigomyiini
Ydiellini*

Moulds (pers. com.) These other Cicadettinae tribes may fall within the above monophyletic group but unknown.

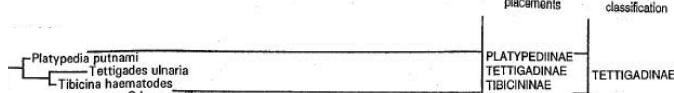

Huechysini probably fall within the Cicadettini.

*Tribes with highly divergent attributes e.g., Carinetini, Hemidictyini and Ydiellini probably require resolution with DNA.

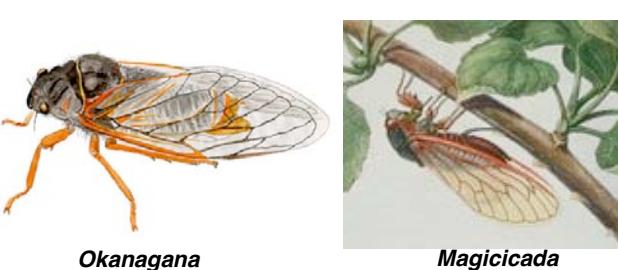

Magicicada now in Tribe Taphurini (also suggested by Maxine Heath)

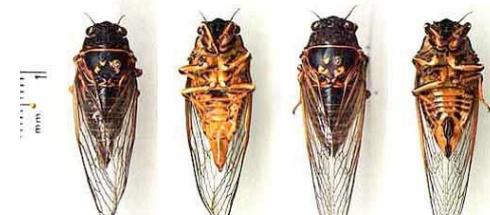

Moulds 2005

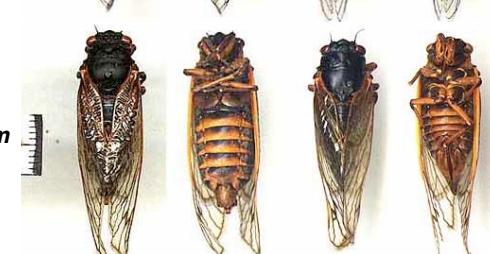

Magicicada formerly placed with *Tibicina* and *Okanagana*

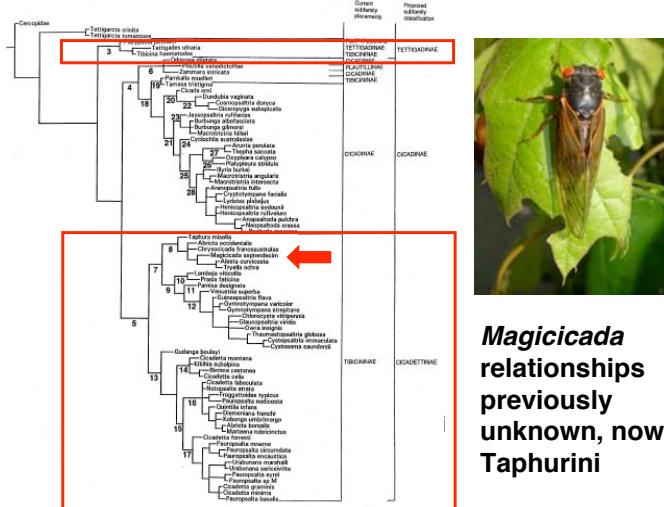

Okanagana rimosa

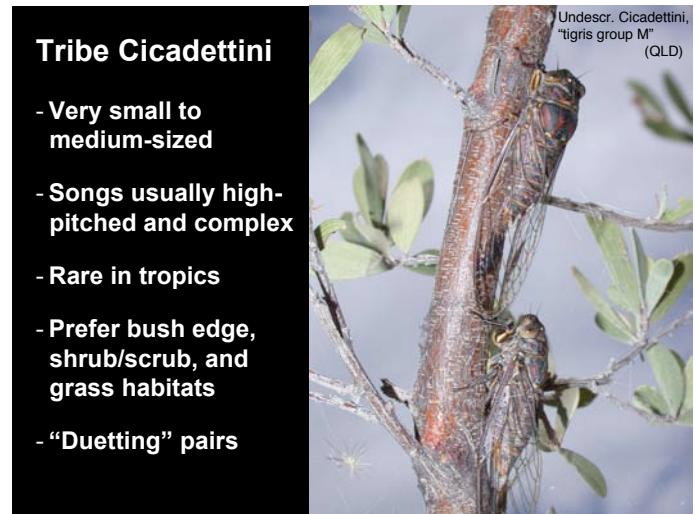

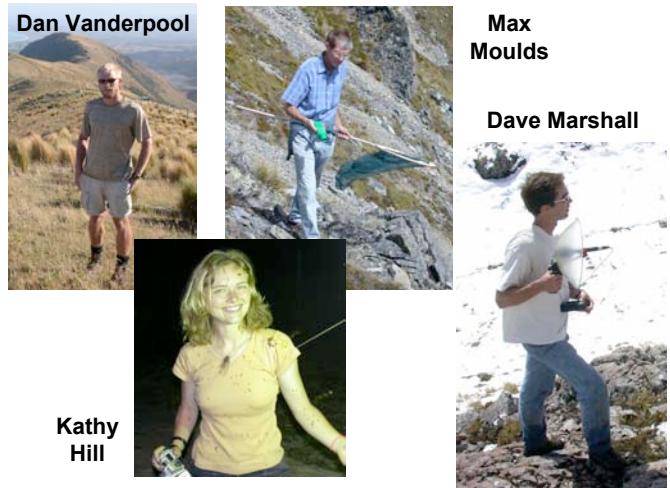

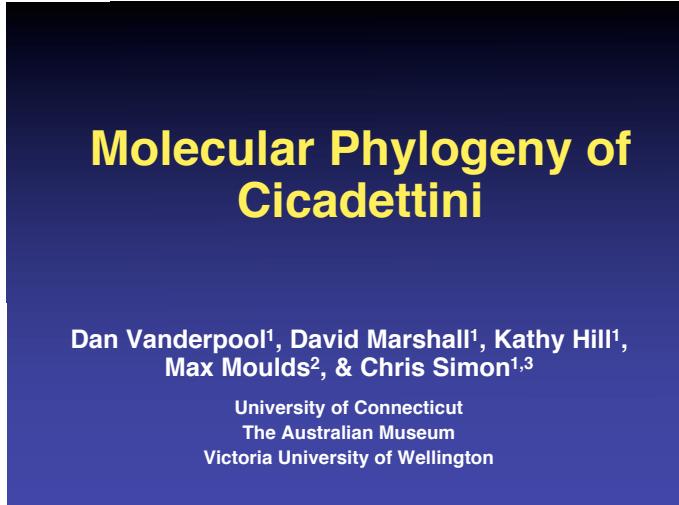

Magicicada septendecim

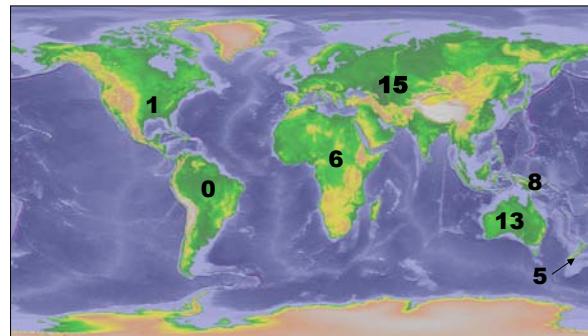

Marobduus gillioni, Ghana
Ydiellini [related to Taphurini?]

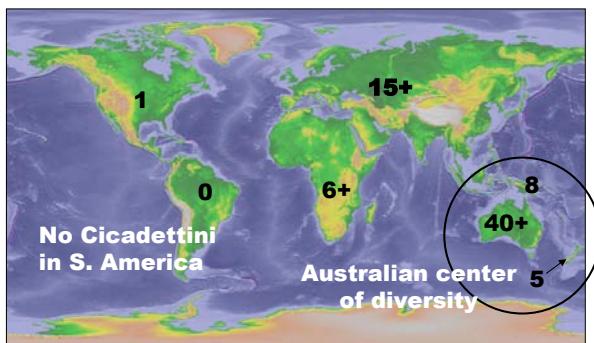

Males can be attracted by imitating female species specific wing flick.

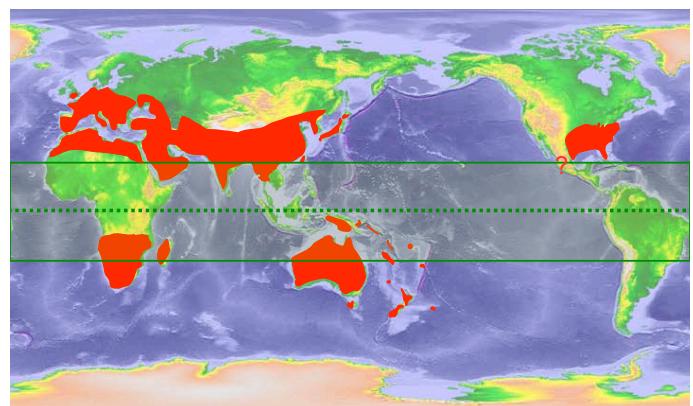

Worldwide Distribution of Described Cicadettini Genera

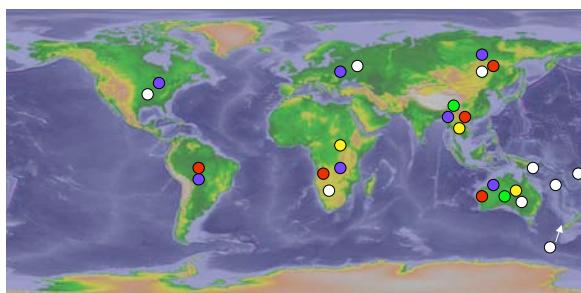

Worldwide Distribution of Described Cicadettini Genera

....a worldwide tribe, but poorly represented in the tropics

Sister Groups of Cicadettini:
Parnisini, Taphurini,
Chlorocystini, & Prasiini

Phylogenetic Questions

Is the tribe Cicadettini monophyletic?

Is the tribe composed of well-defined sub-clades?

Did they originate in Australasia, & spread to other continents?

Did Cicadettini radiate in concert with the aridification of Australia?

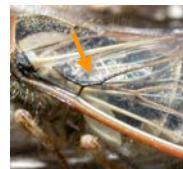

Are Cicadettini post-Gondwanan?

Taxon sampling

- 129 Cicadettini species
- 10 outgroup taxa (3 Chlorocystini, 6 Taphurini)...more to come.
- Cicadinae outgroup (*Tamasa*)
- All continents
- Emphasis on distinctive forms, earlier branching lineages (e.g., type species of all genera).

Tribe Cicadettini

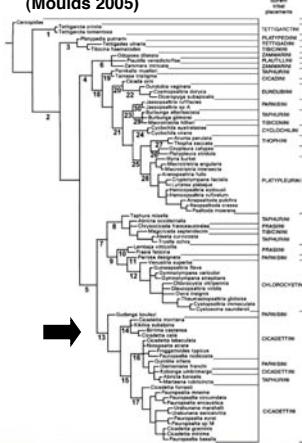

Wing vein variation in *M. phaeoptera*

Dugdale & Fleming 1979, Fig. 4

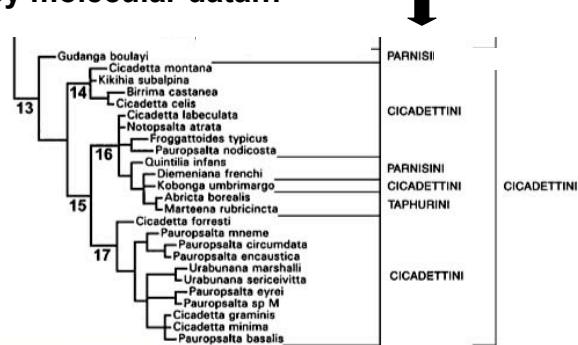

Moulds: New tribal definition based on 4 derived characters; more taxa

Testing the monophyly of the new tribal definition (Moulds 2005)

Cicadettini

Former Tribes of Genera transferred to Cicadettini by Moulds 2005 supported by molecular data...

Genetic Dataset

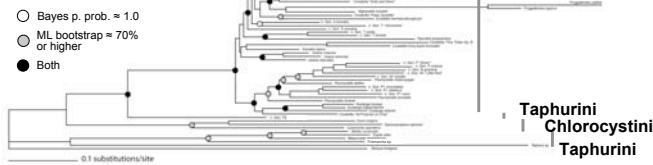

- ca. 1500 bp mtDNA cytochrome oxidase I and II
- ca. 3000 bp nuclear EF-1 α , introns and exons (Some nuclear data still missing)
- All data aligned by eye, gaps treated as missing data.
- Combined data analyses only (this talk)

Phylogenetic Methods

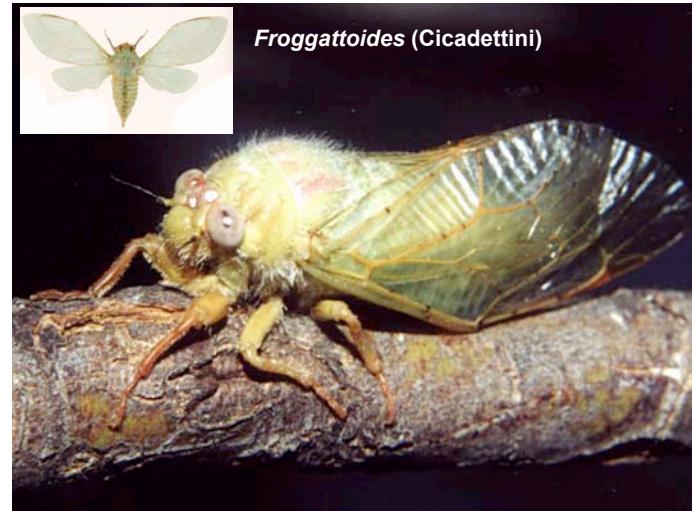

- Maximum-Likelihood (superior branch length estimation; Marshall Simon Buckley 2006, Syst. Biol.)
 - Garli v0.95 (Genetic Algorithm, D. Zwickl), single partition mtDNA+ nuclear, GTR + 8 category gamma
 - RAxML v2.2.1 (A. Stamatakis, SFIT), two partitions, separate model parameters, GTR+CAT, 25 rates.
- Bayesian (80-taxon dataset only – DV)
 - MrBayes 3.0b4, complex six-partition model, separate parameters, GTR+gamma

Phylogeny of the Tribe Cicadettini

- Monophyletic Cicadettini, Moulds' new assignments
- Solid support at key positions along tree backbone
- Major groups well-supported (ML, BY)

Froggattoides (Cicadettini)

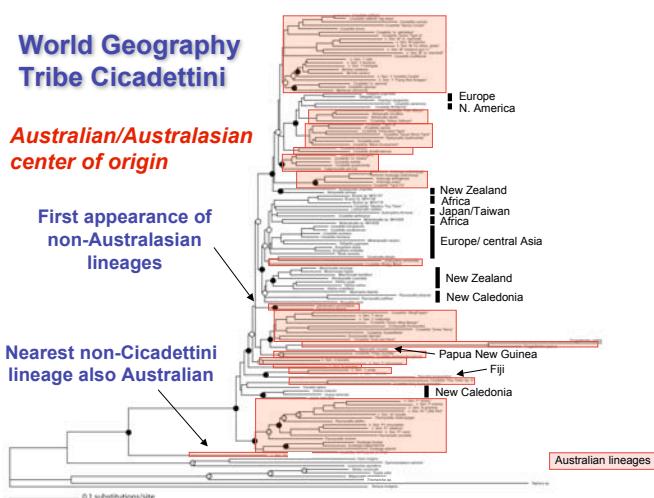

World Geography Tribe Cicadettini

Australian/Australasian center of origin

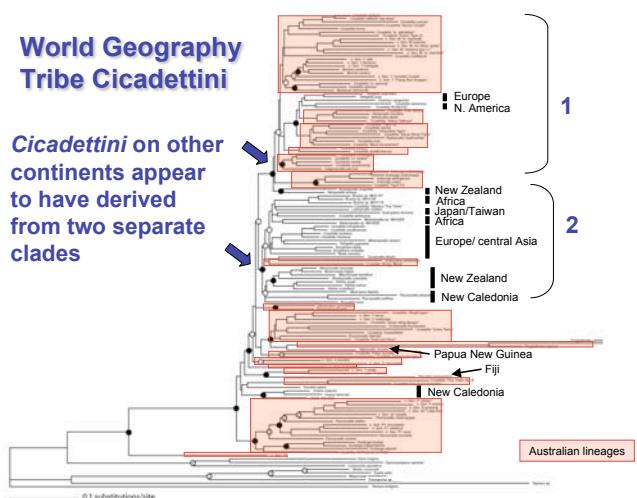

First appearance of non-Australasian lineages

Nearest non-Cicadettini lineage also Australian

World Geography Tribe Cicadettini

Cicadettini on other continents appear to have derived from two separate clades

Clade 1

Australian

European

North America

Australian

Australian

Clade 2

South Africa

Australian

Taiwan

South Africa

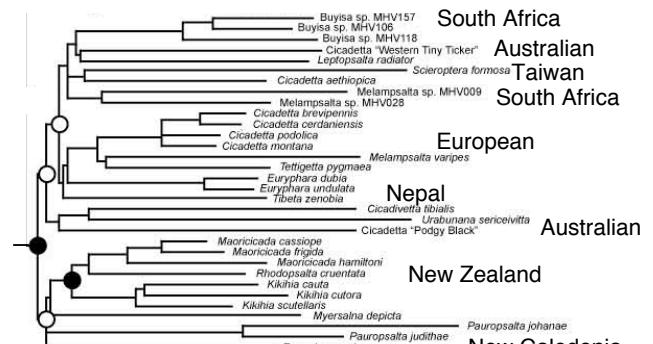

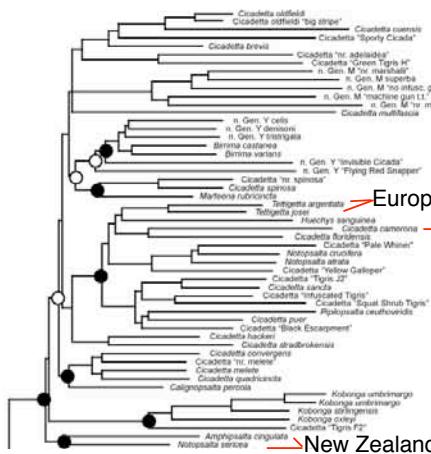

European

Nepal

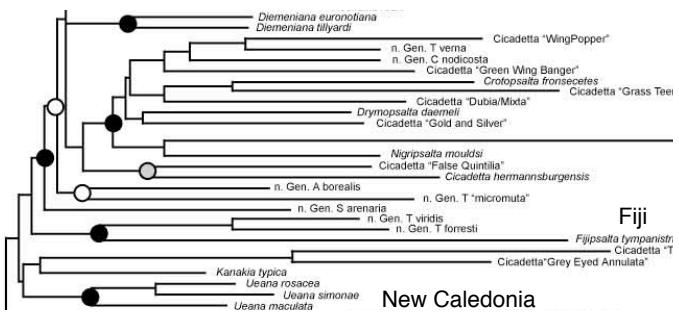

Australian

New Zealand

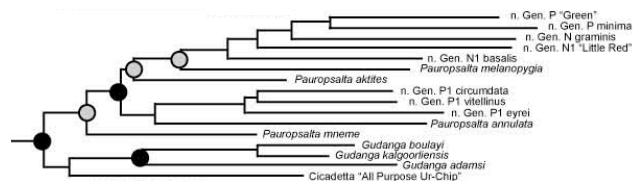

New Caledonia

Mostly Australian Paraphyletic Mess

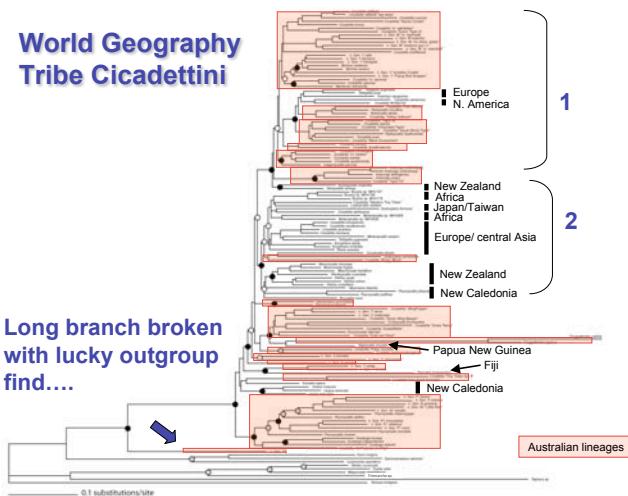

Australian Pauropsalta and relatives

World Geography

Tribe Cicadettini

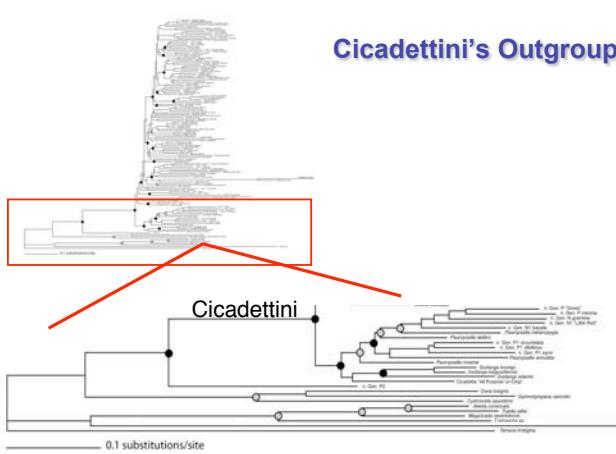

**Long branch broken
with lucky outgroup
find....**

**Breaking long branches,
literally....**

Cicadettini's Outgroups

Molecular Dating – Methods

- Bayesian relaxed-clock, MULTIDIVTIME (Thorne et al. 1998)
 - Tree from partitioned ML (RAxML) analysis, with smaller, representative taxon sample.
 - Diffuse priors ($\text{stdev} = \text{mean}$)
 - Fossil and Geological calibrations

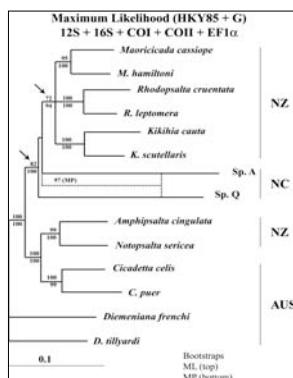

Molecular Dating – 2 Calibrations

Age of large New Zealand cicada radiation (KMR)

- NZ/NC ancestor 7-14 Ma molecular clock and local geological calibrations (Norfolk Island emergence; Arensburger et al. 2004)

Age of *Paracicadetta* fossil lineage (France)

- European presence in late Oligocene (ca. 24 my) (Boulard and Nel 1990)

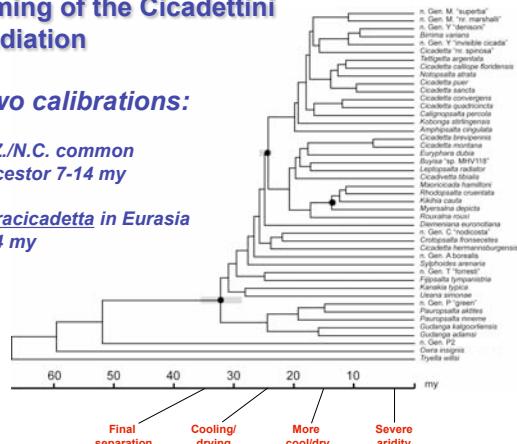

Timing of the Cicadettini Radiation

Two calibrations:

N.Z./N.C. common ancestor 7-14 my

Paracicadetta in Eurasia >24 my

In Summary

- Out of Australia hypothesis strongly suggested
- If true, Cicadettini have colonized the remaining temperate continents during two separate invasions from Australia.
- Diversification began after breakup of Gondwana, probably Oligocene or Miocene.
- Most species have formed during and after the Miocene-era aridification of Australia and other southern continents.
- Narrow tropical “waist” of Central America may help explain absence of tribe from S. America.

Future Work

- Better outgroup sampling and additional fossil calibrations (e.g., Prasiini)
- Biogeographic reconstructions to test the “Out of Australia” Hypothesis
- In-depth phylogenetic analysis of widespread, speciose Australian genera

The End
